I am trying to replicate an application written in PHP+MySql with Upp+Sqlite. I have two questions.

1) With the following table I have problem at runtime

```
TABLE_(DBELO)
  STRING_ (NOME, 35)
  INT_ (ELO)
  STRING_ (CAT, 4)
  INT_ (K)
  STRING_ (SIGLAPROV, 2)
  DATE_ (DATA)
  INT_ (IDFIDE)
  INT_ (IDFSI) PRIMARY_KEY
  STRING_ (SEX, 1)
END_TABLE
```

ERROR Cannot add a PRIMARY KEY column(0): Preparing: alter table DBELO add IDFSI integer primary key

The problem disappears if I move the field  
INT\_ (IDFSI) PRIMARY\_KEY  
at the top of declaration. Is it normal?

I am afraid yes. Why do not you want it to be first?

Hello,

because using sqlitebrowser I can import without problem a cvs file exported by MySql with phpmyadmin. If I mix the column order a mismatch occurs and I need to prepare my own import routine.

Luigi
