OK. Have you seen my STermPro app? It has ArrayGrid with some custom drawing behaviour. I mean, if your record is very large ("tall") and it covers multiple "screens", it is convenient to have some "summary" information even if the main part of record is scrolled many screens up. So, each time user scrolls ArrayCtrl, I draw this summary info inside the visible region of record. It is ok, but ArrayCtrl has internal drawing cache, which is very clever, of course. But I need to update some parts of this cache each time user scrolls ArrayCtrl, because what I draw inside these grids actually depends on scroll bar position. That is why I need WhenScroll event.
