Subject: Dead chars not handled correctly on non-English keyboards

If you want to type the text "~n" on a Belgian/French keyboard, you have to type the 'dead' character '~', then a space to make the tilde apear and then a 'n'. If you ommit the space, you get

nationalities.
But when you type the tilde and the space in any of the Ultimate edit field flavours, you get " ~". In other words an unwanted space character is prepended. The same is true for the other dead

characters as standalone characters (not combined with another character), you always have to go back to remove the leading space.
