dolik.rce wrote on Thu, 06 May 2010 02:36Hi Phirox,  
Very nice!

The dependency on previous installation of theide can be overcome. There is a generic Makefile, that can build any U++ project. For this purpose the usage would be something like `make -f uppbox/lpbuild/Makefile PKG=ide "FLAGS=GUI MT GCC SHARED" DIRS=uppsrc` Would that work?

Honza  
I give my 2 cents since I use Gentoo as well...

Yes it would work perfectly with this Makefile, but the question is how to make it available to the ebuild. I think the best solution is to add it to the files/ subdirectory of the ebuild directory, and copy it in the right place at the end of the unpack step.

phirox, what do you think about it ?

Lionel
