Hello all,

How about to implement in SQLITE bind parameter by name? not only by index.

example of sqlite text:

```
"SELECT * from sqlite_master where type=table and name =:table_name"
```

in SQL class need to add member:

```
Sql::SetParamName(String p_name, int p_index);
```

or add direct:

```
Sql::SetParam(int i, const Value& val, String p_name)
```

or

```
Sql::SetParam(String p_name, const Value& val) // auto increment parameter index
```

by using:

```
const char *sqlite3_bind_parameter_name(sqlite3_stmt*, int);
```

Can I add this functionality and propose for adding in library?

Any opinion are welcome!

Best regards, Ion Lupascu (tojocky)
