Hello all,

How about to implement in SQLITE bind parameter by name? not only by index.

example of sqlite text:

"SELECT * from sqlite_master where type=table and name =:table_name"

in SQL class need to add meber:

Sql::SetParamName(String p_name, int p_index);

or add direct:

Sql::SetParam(int i, const Value& val, String p_name)

or

Sql::SetParam(String p_name, const Value& val) // auto increment parameter index
by using:

const char *sqlite3_bind_parameter_name(sqlite3_stmt*, int);

Can I add this functionality and propose for adding in library?

Any opinion are welcome!

Best regards, Ion Lupascu (tojocky)
