klrkt wrote on Fri, 14 May 2010 23:14 Thanks for the reply, but I want to setup uppWeb for my custom app, on my system.

Hi,

Unfortunately, uppweb can not be used to do that. But you can reuse some pieces of the code...

The absolute basics is function

```
String EncodeHtml(const RichText& text, Index<String>& css,  
                  const VectorMap<String, String>& links,  
                  const VectorMap<String, String>& labels,  
                  const String& path, const String& base = Null, Zoom z = Zoom(8, 40),  
                  const VectorMap<String, String>& escape = VectorMap<String, String>(),  
                  int intolerance = 0); and few related ones from RichText package.
```

Generally, I would recommend you to have a look at the code in uppweb package, everything you need is there...

Best regards,

Honza
