koldo wrote on Thu, 27 May 2010 10:05 What is your thesis about?

Hi Koldo,

The name is "Study of complex structure of material using pair distribution function (PDF)". My field of interest is X-ray crystallography.

The software I wrote and mentioned in the thesis are just some basic number-crunching tools. Mostly fourier transforms, medium datasets (<10k points, but while playing with it I once got to 15M points and U++ didn't even seem to notice ), nothing really novel. The most interesting part would probably be nanoparticle modelling, but it is still pretty lame

Honza
