
Subject: Column type for SQLite

Hello,

Currently, when executing a select statement in sqlite, the column type is determined by the first row fetched. When a value in that record happens to be null, the type for that column will always be known as VOID_V.

The code in the execute procedure, responsible for this is:

```
case SQLITE_NULL:
    field.type = VOID_V;
    break;
```

wouldn't it be better to extend it like this:

```
case SQLITE_NULL:
    if(coltype == "date")
        field.type = DATE_V;
    else
        if(coltype == "datetime")
            field.type = TIME_V;
        else
            if(coltype.Find("char") >= 0 || coltype.Find("text") >= 0 )
                field.type = WSTRING_V;
            else
                if(coltype.Find("integer") >= 0)
                    field.type = INT_V;
                else
                    if(coltype.Find("real") >= 0)
                        field.type = DOUBLE_V;
                    else
                        field.type = VOID_V;
            break;
```

This same technique is already used for detecting dates and times in string fields. So I see no harm in doing the same for null values.
