Hi,

This looks like a compiler optimization. The compiler recognizes that value of a is actually not used before you assign it the result of that call to p(10,20).

Just to make sure: What version of U++ are you using? You can find it in Assist>About... Since you said you are using mingw which is not distributed with U++ anymore, I guess you have version 605, am I right? If so, please upgrade to something newer. Just have a look in the Download section for links. Also, if you downloaded that ancient mingw release, you should consider upgrading the mingw to newer version (have a look in this thread).

Bye,
Honza

PS: Could you use some other file format than .doc next time? Some of us don't have Office/openoffice installed. Pdf or any image format would be nice, thanks.
