Hello everyone,

transfer is based on a RF link between two PCs, and the RF modules will be connected to PC through serial port. Basically I want to apply a protocol for error detection and correction for serial connection in the file transfer.The one I'm looking into now is called kermit. But kermit doesn't have a open source version for Windows platform.
I was wondering if anyone has experience to handle this kind of communication problem can give me some suggestions.

Thank you.
