Thank you for your response,

Quote: You can assign it to the column like this:

```
grid.AddColumn("Date").Edit(date);
```

I need it on a line like a header where i apply filter (by date, an autocompletion into a editString, sort by code,...).

I tried to use an easy way by superposing my controls juste under the header and it have another bug: it does not refresh drawing as well when i scroll vertically.

(Sorry for my english, i 'am french speaker!!)
