Hi all,

(I am not a C++ developer, so I use U++ for write my applications).

I am using ArrayCtrl for show some variables readed from an external device connected via bus. These variables should be formatted in various mode: decimal, hexadecimal and binary.

ArrayCtrl offer, (what I found), two way: 1) column editor that can can be one of many offered from U++ or self made with own converter; 2) cell editor, with the same peculiarity of the point 1).

My problem: I want to list my vars not in columns, but I rows, so, for the same column, but different row, I have to connect the cell with and different editor, using SetCtrl(..).

The problem is: Now my vars can be showed in lot of format: binary, decimal, hexadecimal, but they are also editable, and I don't want this. The editor can be disabled, yes, but it change is color and is not so easy for read the value.

Question:

- 1) How I can connect every single cell to an different converter, not editable?
- 2) How I can change this converter in runtime?

Hope for some help.

Thanks.
