i add delays into your code and the timer killing is asynchronous with timer callback execution. I regard this as a flaw. I can kill it, but I cannot know whether it is executed. I have to choose other implementations.

```
class MyWindow : public TopWindow
```

```
{  
    typedef MyWindow CLASSNAME;
```

```
public:
```

```
    void Count()
```

```
    {  
        //here 2nd.
```

```
        Sleep(10000);
```

```
        //here 5th.
```

```
    }
```

```
};
```

```
void MyThread(Callback cb)
```

```
{  
    TimeCallback timer;
```

```
    timer.Set(1000, cb);
```

```
    //here 1st.
```

```
    Sleep(5000);
```

```
    //here 3rd.
```

```
    timer.Kill();
```

```
    //here 4th.
```

```
}
```

```
...
```
