Quote:i disagree on that one Smile. i have the impression that finding corresponding brackets is easier when they are placed on new line each. i know that Assist++ marks brackets, but it's also a visual perception of blocks, that matters, and here the new line stuff is better.
And I disagree with you I prefer more compact code so that I can scan it more easily (one of the reasons I dislike many verbose comments) and I don't find it makes finding pairs any harder. I feel it makes it easier to see the code structure personally.
