I prefer the second option, because I pair the "}" with "if" and that's more interesting for me than pairing it with "{". But I can see this is matter of personal taste. (also I would write "if (a == 123) {" (notice the spaces) to fully satisfy my taste)

And assigning 123 to a in comparision without additional comment about intentionally doing so is not nice (I write in such cases code this way to make my intention obvious: "if ((a = 123) != 0) {", otherwise I consider it typo bug and fix it to "==")
