I have made some changes based on my ideas and I can see that I am able to gather characters in the Rx Buffer. Can anyone help me to append the data that I get from the class to the DocEdit box?

The relevant file is the main.cpp The section I need help with is in CommPak::CheckRxTmr()

I am not sure if the timer gets destroyed when I close the topwindow. I tried to do a WhenClose, but I think I need to do more than what I am doing right now since it crashes if I use that callback. Without the callback it seems to work fine.
