sometimes its cool to group things together in an easy manner, especially when working with the template containers. to build a grouping container over and over again each time for different purposes, just for classes that would have the parts public anyway, is odd.

say you want to have a vector that simply contains a 2-tupel of values. maybe some measurements consisting of two values at once, or anything that logically belongs together but does not need any abstraction or scope hiding. a normal container cant do it.

Vector<float, float> vi; //would resemble VectorMap.

you just need to quickly define and access 2 things at once in a container and want to have sth like

```
Vector<Duo<int, int> > vi;  
...  
vi[i].t1 = 123;  
vi[i].t2 = 234;
```

this looks good and is handy.

so here comes some helpers to do that

```
template<class T>  
class Solo  
{  
public:  
    typedef Solo<T> CLASSNAME;  
    Solo(const T & _t) : t(_t) {}  
    Solo() {}  
  
    operator T & () { return t; }  
    operator const T & () const { return t; }  
  
    T t;  
};
```

```
template<class T1, class T2>  
class Duo  
{  
public:  
    typedef Duo<T1, T2> CLASSNAME;
```

```

Duo(const T1 & _t1, const T2 & _t2) : t1(_t1), t2(_t2) {}
Duo() {}

operator T1 & () { return t1; }
operator const T1 & () const { return t1; }
operator T2 & () { return t2; }
operator const T2 & () const { return t2; }

T1 t1;
T2 t2;
};

template<class T1, class T2, class T3>
class Trio
{
public:
    typedef Trio<T1, T2, T3> CLASSNAME;
    Trio(const T1 & _t1, const T2 & _t2, const T3 & _t3) : t1(_t1), t2(_t2), t3(_t3) {}
    Trio() {}

    operator T1 & () { return t1; }
    operator const T1 & () const { return t1; }
    operator T2 & () { return t2; }
    operator const T2 & () const { return t2; }
    operator T3 & () { return t3; }
    operator const T3 & () const { return t3; }

    T1 t1;
    T2 t2;
    T3 t3;
};

template<class T1, class T2, class T3, class T4>
class Quartett
{
public:
    typedef Quartett<T1, T2, T3, T4> CLASSNAME;
    Quartett(const T1 & _t1, const T2 & _t2, const T3 & _t3, const T4 & _t4) : t1(_t1), t2(_t2), t3(_t3), t4(_t4) {}
    Quartett() {}

    operator T1 & () { return t1; }
    operator const T1 & () const { return t1; }
    operator T2 & () { return t2; }
    operator const T2 & () const { return t2; }
    operator T3 & () { return t3; }
    operator const T3 & () const { return t3; }
    operator T4 & () { return t4; }

```

```
operator const T4 & () const { return t4; }
```

```
T1 t1;  
T2 t2;  
T3 t3;  
T4 t4;  
};
```

maybe they can go to Others.h..
