[quote title=mtdew3q wrote on Fri, 06 August 2010 19:20]hi-

I'd like to use Firebird. I saw where that is probably possible with oledb. I think as long as there is a session I can do similar things to Postgres, MySql, etc.

My question is before proceeding is how do people handle transactions?

SqlSession::Begin()
SqlSession::Commit() / SqlSession::Rollback()

As single main database session is usually represented as 'SQL':

SQL.Begin()
SQL.Commit() / SQL.Rollback()
