
Subject: ColumnList - Set(Value key, Value val) - Working right?

I have the following code:

```
Value id = codelist.GetData();  
codelist.Set(id, "Hello World!")
```

It does not change the selected item. Instead it seems to be changing the item at an index of "id".

This code works as expected:

```
int idx = codelist.Find(id);  
codelist.Set(idx, ~d.value);
```

From Assist++ it seems that .Set(Value key, Value val) should set it based on key, thus the first example should have worked?

Jeremy
