<speculating>

Not exactly sure what Array class does, as I haven't learnt NTL or concepts like "pick" yet (shame on me), but according to Array documentation, Array owns its contained objects, so maybe that means the class needs a virtual destructor anyway, otherwise the derived destructor is never called ??

Even if typeid failed to detect a derived type for some cases, it might help other cases, and a mechanism for disabling the runtime assert is probably easy to provide.
