Subject: Disable library functions

Hello all

I get errors linking avcodec.lib (ffmpeg) into a GUI application.

z.lib(inflate.obj) : error LNK2005: _inflateReset already defined in avcodec.lib(avcodec-52.dll)
...

It seems the reason is that zlib is included in Core and also in avcodec.lib.

It is the same with MSC and with MinGW.

Do you know if it is possible to disable functions in a linked library, or at least to hold those functions usable only inside that library?
