Well, I'm trying a different way, indeed.... I rewrote an help window (named HelpViewer) which allows a table of contents (TOC), which is loaded automatically from TOC\$xx-xx.tpp files. It's almost working, and it gives automatically an order to generated html pages, a nice index on help window and should allow generation of PDF with table of contents too.

By now the TOC is a bulleted list, with indenting depending of chapter-subchapter.... relationship; that one could be easily translated automatically to a treectrl parsing the corresponding QTF, if wished.

So, you create the help, add a TOC topic with ordered list of links inside and you can generate an ordered html series with toc, or a pdf with TOC too.... or just use my HelpViewer to show help with TOC on left side.

I've got just a problem converting bulleted lists to html... bullets and indents are not translated; see the attached file and corresponding html and css.... the css is right, the html not.

If you've got some idea on how to solve it would be great

Ciao

Max

Edit : BTW, we should document somehow that damn'd EncodeHtml stuff, I got more than one day figuring out what parameters means....
