Hi,

Some simple queries regarding ArrayCtrl, such as:

- 1.- Once the controls have been created by using Ctrls method, how can I:
 - 1.1.-detect that an specific control has been updated (i.e. modified by the user);
 - 1.2.- retrieve the new introduced value (for instance, the new value might be a new string);
 - 1.3.- detection of user click on the array. I have noticed that GetClickPos method does not work when the click is made on an control within the array. Am I mistaken?
- 2.- How can everything be handled by WhenCtrlsAction callback? are there other ways to do this?.

Many thanks,

Javier
