Subject: Doking:Does the Dock Manager work correctly?

I am referring to the examples given in Bazaar (for instance DockingExample2). When using the Dock Manager Windows/Groups tree, and you perform some grouping/relocation operation (naturally, you have created some new groups previously), some ctrls (nothing to do with the

all). It seems that there is something wrong with the tree. Please correct me if I am mistaken.

-DockingExample in this specific case-)? This is to allow the visual lay out design of the Main Window.

Cheers
