Your example is quite fine.

I have some queries regarding Ctrls:

- 1.- for example, how do you know what control has been updated?. To me that is a kind of an enigma. From your example, after an event on a ctrl, all the rows are read and written to l.
- 2.- What is DUMP(1)?;what is its role in the destructor?

I am enclosing what I have done. I am afraid that there are much better ways to do it (basically I dismissed Ctrls and opted for SetCtrl; I have created several Arrays of controls and then I have to update all the Arrays every time a layer is added or removed: it looks convoluted; am I overcomplicating this?).

possible to do it with Ctrls and/or widgetfactories?.

Cheers,

Javier
