Thank you for your advice.

As you are well guessing, the number of rows (layers) will be small, so your approach is correct as well.

Regarding the id of layers, it is made on purpose for this is a unique identifier, created at the time

layers erased/created.

Unless I am mistake, IMO, there are no other ways to do this task. What surprises me is that, apparently, Ctrls has some limitations, although the concept is impeccable.

Cheers,

Javier.
