Could we do a second windows installer including all just out of the box, like MinGW and SDL?

This way a windows user just run the installer and will compile and run U++ examples.

The actual packages to do windows installer could be modified to do both.

Do you agree?. If yes, I can do it.

I suggest to:

- keep Google automated builds as they are
- possibly put mingw releases to "official" sf.net downloads.

I agree 100%.
