We had hoped that we could utilize TheIDE as a development environment for our existing C++ project on the Windows and Linux, just as you can import existing source trees in Eclipse or KDevelop, but I couldn't find out how to achieve that.

Our project (see <http://lavape.sf.net>) is based on Qt4 and runs on Windows, Linux, and further Unixes. On Windows we'd like to support also the MinGW g++ compiler, but we have existing custom makefiles that we'd like to use also for MinGW. The project workspace contains a number of subdirectories (belonging to sub-projects having their own makefiles).

Is it possible to import such a project structure into TheIDE?

Many thanks in advance for your help.

Klaus.
