I'm with Uno(Daniel) on this one. I constantly go from not using U++ at all (=> not having time to improve it) to using U++ for extended periods of time (=> not having time to improve it). When I'm using it I absolutely love the library itself, but TheIDE is in need of a lot of final touches. The big ones would be things like make the "go to" fail proof once and for all (when not dealing with macros) and namespace support. The small ones would be disabling double click on the tab bar or fixing the stupid temporary scroll on mouse wheel.

With so many areas where one could bring improvements, I don't think we fit other languages in the schedule. I would rather improve TheIDE from a 8/10 editor to a 9/10 then keep it as 8/10 and also make it a 3/10 something else editor. But small touches like XML editor can be added safely.
