You can use LLVM compiler if you want to. Just set llvm-g++/clang as a compiler. Thanks to the same syntax it should work just fine.

Honza

In my case it produces executables twice bigger than with GCC. Probably linker should also be substituted. But this is not possible because it is hard-coded in C++. Actually, hard-coded names of tools make impossible to use MinGW compiler on Linux. You can replace name of a compiler, but linker and librarian cannot be replaced.
