Subject: Basic MT queries

Hi,

I am attaching a simple snippet with a thread that performs a dummy loop. I have some very basic queries:

- 1.- how to stop/start the thread by using the buttons? I guess that ShutdownThreads function is the right one to raise a flag but although the loop stops, the application remains stuck.
- 2.- I have seen some global functions that are available, such is GuiLock\_; is there any information about such a function and other related functions?. What is it for?

Many thanks.

Cheers,

**Javier**
