jeremy\_c wrote on Thu, 19 August 2010 09:32Ok, I am attaching the Scgi package as well as a ScgiHello example. It now handles parsing query string, post data and server variables internally. There are no docs yet but it's use is pretty simple to figure out. The ScgiHello example helps w/this as well.

Once it gets a review or two, I'll make any corrections and start documenting. The ScgiHello example includes a sample LigHTTPD configuration file that should run out of the box.

It does use some signal handling which I have not tested on Windows.

I would like to upload this and begin to maintain this in Bazaar. How does one go about doing that? (Oh, I have the MultipartForm class that I added to Web/util.h/cpp that I think would be helpful for others).

Jeremy

Perfect! (sorry for begin late here...)

In fact, I think this can go directly to uppsrc, bypassing bazaar this time. Just please test if this works in Windows too...

ScgiServer now in uppsrc.

I am sending you access info to svn server now...

Mirek
