Hello,

It was developed for very practical purpose and clear target. Here you can see commercial applications

[http://ultimatepp.org/www\\$uppweb\\$app\\$en-us.html](http://ultimatepp.org/www$uppweb$app$en-us.html)

developed by their team leaders. At that time for them was better to build a new tool and library instead to use the existing ones.

Quote:

allows creating commercial applications without LGPL related restrictions. But unless the popularity of U++ increases, U++ is doomed not to survive very long.

At some moment they decided to make public their work and make a great gift to us. With it I did a commercial application

http://www.vegachess.com/tl/index.php/Home_page_English.html

that is one of best in its field and the only able to run in linux and windows. I started as a C++ beginner and I was helped by the forum.

Upp has everything I need. The community is superb and add new stuff when one face new problem and solve it with Upp.

I do not share your worry.

I suppose other users/developers, as me, use it because with Upp their real work is easier and faster than other tools around.

For me was easy to find this site when I was looking for a library to realize my needs. If other people miss this chance it's a pity for them.

If some years ago I had chosen the most popular widget library now I was somewhere else. Popularity itself is not a value.

Luigi
