luzr wrote on Mon, 04 October 2010 13:12Looking at it, I have strong impression that in this case it would be more logical to use virtual methods instead of Callbacks. I guess even HelloScgi would be quite simpler that way..

Also, as this seems to be quite short piece of code, I consider moving it to Web package (you would retain access rights there too).

What do you think about this?

I was thinking the same about virtual methods vs. callbacks.

In regards to moving to the web package, that depends on how you would like the overall structure. Say someone else comes along and makes FastCGI and then WSCGI... How would you envision those being added? I'm not saying someone is, but just something to think about.

It does seem odd out there in uppsrc/ all by it's lonesome.
