Frankly, 5 years ago I would care. I suspect U++ is the best in technical terms in many areas and it is pity all these fancy ideas have so little adoption (did you e.g. know that U++ memory allocator spends on average much less than single byte per allocated block to store book-keeping information?)

Anyway, today all I care is that I can do my job with U++. Going up on popularity ladder is so hard that personally I am exhausted trying

OTOH, it seems like new smart people like Koldo are slowly energizing the whole process and U++ is starting to grow again. Which is perfect situation for me, as I can concentrate on things I can do best (that would be core development)...
