I don't know how much useful for your case but you can try to study `ide/Custom.cpp`:

```
class CustomOrder : public ArrayCtrl::Order {
public:
    virtual bool operator()(const Vector<Value>& row1, const Vector<Value>& row2) const {
        for(int i = 0; i < 3; i++)
            if(String(row1[i]) != String(row2[i]))
                return String(row1[i]) < String(row2[i]);
        return false;
    }
};
```

and related stuff...
