Well, Eclipse may be popular, but it is not very good for C++. It is slow, has way to many options, C++ debugging is not the greatest fan of templates the code analyzer breaks routinely when using more fancy stuff or just full on macros or huge projects. Waiting 10 seconds after a "." or a "->" (worst case scenario) is not fun. Luckily, these case are rare enough that they are just a minor annoyance. At its best, it is way better than TheIDE. On average, it seems slightly worse for C++ and better for C, not counting TheIDE learning curve. For Java on the other hand it is awesome.
