I posted last version of web authentication package.

Still no docs, but code is enough self explaining.

As before, there's a ProtectServerDemo and a ProtectClientDemo test apps.

All work besides license activation, mail is sent but the activation link is still not ready.

To test it, as before, you shall setup an http server with SCGI module installed.... By now I'd suggest it only for people experienced enough.

On next days I'll setup the test server.

The app supports multiple licensing, timed demo, check for multiple runs of the application and so on.

Ciao

Max
