kohait00 wrote on Wed, 13 October 2010 06:24i think the typedef is an easy way, so we can use NTL_MOVEABLE
here a short idea.. if anyone knows how to specify the salt for the name in a better way, welcome.. with this,

```
//V1
#if 0
#define TUPLE2_MOVEABLE(T1, T2) \
typedef Tuple2<T1,T2> COMBINE3(TD_,T1,T2); \
NTL_MOVEABLE(COMBINE3(TD_,T1,T2)); \
```

```
#endif
```

```
//V2
```

```
#if 1
```

```
#define TUPLE2_MOVEABLE(T1, T2, salt) \
typedef Tuple2<T1,T2> TD_salt; \
NTL_MOVEABLE(TD_salt); \
```

```
#endif
```

```
//V1
```

```
#if 0
```

```
TUPLE2_MOVEABLE(Point, Size);
```

```
#endif
```

```
//V2
```

```
#if 1
```

```
TUPLE2_MOVEABLE(Point, Size, 123);
```

```
#endif
```

```
//this enables Vector<Tuple2<Point, Size> > to be used
```

Too verbose, we need something more sexy...
