One of my systems is a netbook ASUS Eee PC 1001P, the second system is a modern desktop with discrete video (NVidia GSO 9600). My third system is 4 years old (Pentium 4 3Ghz, int. video). But I saw this issue on other systems. Every system I tried runs Windows XP SP3. Now this issue is mystycal for me...

For Mirek: May be a delay happens at the stage of initializing the window? Because when a window is moving, or when it is minimizing / maximizing issue doesn't occur.
And a silly assumption: all of my systems are running Russian edition of Windows XP. Can there be a reason for this issue?
