Subject: Re: The makefile of an export NOGTK project dropped an option -lpng
Posted by dolik.rce on Mon, 01 Nov 2010 23:41:24 GMT

Hi Sevenjay,

Thanks for spotting this, it should be fixed now. It was caused by comparing unix style and windows style path, such a simple detail as \ vs. / makes a difference If M$ would follow the same conventions as the rest of us, none of this would happen

Funny thing is, that it didn't make any trouble in normal mode (without NOGTK), as libpng is pulled in by gtk. I guess that is one of the reasons nobody noticed that so far (the scarce usage of exported makefiles being the other reason).

Best regards,
Honza
