
Subject: FileSel has classic Windows look since r2848

The latest additions to the FileSel component (r2848) have resulted in a problem on Windows (Vista). The file open dialog now looks native (so far no problem), but it has the classic, unthemed, windows look instead of the modern Vista look.
If I comment out the additions done in this revision to FileSel.cpp, the themed look is restored. Frankly, looking at the code, I have no idea why that is. The call to GestSystemMetrics, perhaps?

Added 2010-11-18: Hmm, weird; on Windows 7 commenting out the added code does not solve the issue. Were there more changes done that affect the file selector than those in FileSel.cpp? To be honest; I liked the non-native Ultimate look better. Is this change of look also a result of r2848 (I do not follow every single revision)?

Aha; got it. So there is FileSel and FileSelector. Aren't we spoiled. So, for the Ultimate look I need FileSel and for an (almost) native look, I need FileSelector.
Can anyone enlighten me why these two exist? Why not have one and have a flag 'SetNativeLook' or so. The situation now is pretty confusing.
