That's a really really great news. Can't wait to try it in action. That would save me a lot of time. I could simply avoid creating web version of my app. Gtk guys use canvas and javascript - seems to be a good choice.

Unfortunately, javascript appears to be to weak for RDP-like stream...

We would need at least Java to get what we want.

Plus, perhaps this technology will help in similar cases where Terminal services is usable, but would have big problem when your web latency is too high (just like with TS).
