Subject: PROPOSAL: "MyClass + MyClassTest" Template in TheIDE
Posted by kohait00 on Wed, 01 Dec 2010 07:07:57 GMT

hi guys,

more often then not one, enjoying the package system of U++/TheIDE, starts to create a new module / class library, which should be integrated later in another application, but 'for now' needs to have a test environment, where to develop / stimulate the API. espacially in own Ctrl development..

what about having a code generator Template, just as the other ones, that, in fact, creates 2 packages, and opens the second one, which already 'depends' on the first one?

MyClassName
/\
||
MyClassNameTest

this could be done for a CtrlLib based 'MyClassName' package or for a Core based one. but 'MyClassNameTest' would always present a CtrlLib project.

i think everything is already present in the ide, but would need to be put together in right direction..
