Cool! Is there an example of this? I already have serialisation functions to copy to and from the clipboard (if that is how it is done).

I get that I need to override DragLeave() in my TreeCtrl and I see there is a member called Clipboard that is of type PasteClip. I imagine that I need to create a StringStream and serialize to it. However, connecting the StringStream to the clipboard is where I am missing a piece.

Hmmm, the more I look the less I think I have a clue. There are no reference examples or documentation for this and when I look at the objects involved (like PasteClip) there are no functions which would let me write to the clipboard.

Nick
