wouldn't it be better to also implement this for ArrayCtrl?
Well, moving cursor is IMO the correct way to deal with embedded controls and most of grids works this way otherwise you break consistency in control's callbacks. On the other hand Mirek has different opinion here. If I remember correctly he wanted to be able to type the text in one row without loosing focus by clicking option/button/droplist in another row or the same row but in another column. Cursor is moved only if you click on edit control. Actually I don't know in which scenario this can be useful .
