Hi Mirek and undogs,

Quote:Another option is to use GridCtrl where you can enable/disable editing for particular row/column or cell.

Actually I'm using SqlArray so changing to GridCtrl is not plug&play so I'll stick with SqlArray for now.

Quote:If the ArrayCtrl is not supposed to hold MANY rows, I would probably used "the other" method of editing it, with embedded widgets for each row, and simply not assigned any for rows I do not want to edit.

```
void ArrayCtrl::SetCtrl(int i, int col, Ctrl& ctrl, bool value = true);
```

I will try this method, I didn't see it. I thought edit ctrls were only set to rows.

NB: I don't have many rows, and never will (max 100)

Thanks !
