
Subject: CtrlCore on Mac - xcode files and video

Not much but some progress!

There are 2 zips for mac inside the attached zip - minimum required uppsrc packages with some changed defines in Core etc. and the heavily modified CtrlCore.

If you dont want to edit xcodeproj files, then I would suggest to put them into /Users/Shared/upp and then unpack. You should get:

1. /Users/Shared/upp/uppsrc - filled with minimal set of upp packages Core, plugin, Draw etc..
2. /Users/Shared/upp/xcode/uppsrc - filled with xcodeproj files.

You should only need to start CtrlCore.xcodeproj, others should compile and link as dependancies.

Try and leave your questions and comments here, please - at least I would now how much someone would be interested and able to help.

P.S I think, upp mac apps without nib files will be better than Qt's ...

P.P.S

(Sorry, the sound after uploading somehow vanished.)

Aris

EDIT: Use "Release" mode in Xcode even for debugging. Debug mode needs more tweaking in Core.

Also, you will/might need to rename unzipped file dirs. See at the top.
