BTW, if you don't want to really bother with some big DB, you may try SQLite file database on shared network folder.

I'm not SQLite guru to say for sure this is reasonable approach, but if you do a quick check over sqlite docs, you will probably find there some recommendations if such usage pattern is desired and if sqlite will take the burden of locking/synchronizing files from you, so you can focus on app code and use just SQL API to read/write data.
